#### Main features

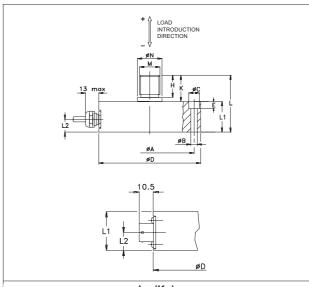

- Range of measurement: from 100 to 20.000 Kg
- Accuracy class: 0,2%
- All stainless steel construction
- · Corrosion resistant
- · Internally generated calibration signal
- Grade of protection: IP67 (DIN 40050)

TC series load cells are strain gauge transducers used to measure loads in static and dynamic applications, in tension (positive signal of output) and compression (negaitive signal of output), with high accuracy (industrial weighing, laboratory testing, automation, etc).

The TC series is machined from a single block of metal, so the primary sensing element, the mountings and the case contain no welds allowing smaller dimensions and an enhanced grade of protection.

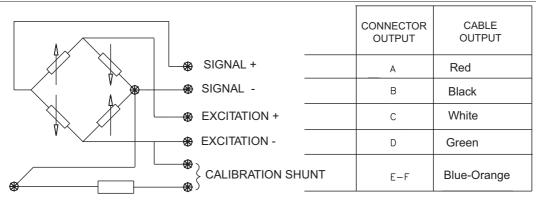

The configuration of the point of measurement, with 8 strain gauges, reduces errors caused by imperfect application of the load. Typical applications of load cells connected in parallel are: silos, hoppers, large weighing platforms, and with suitable accessories, suspended loads. The stainless steel construction is suitable for use in aggressive environments in the chemical and petrochemical industries.

#### **ELECTRICAL CONNECTIONS**

NB.: The output signal is positive for traction loads and for calibration, and negative for compression loads.

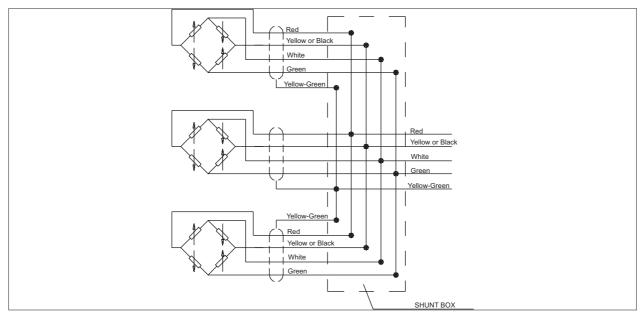

6x0.25 Screened cable

If the transducer is supplied complete with prewired connection cable, the colour code is that indicated in the table.

\* The screen is isolated from the transducer body. It is recommended that the screen is connected to ground at the instrument end.

### Cells connected in parallel

In systems that use several cells, the parallel connection automatically sums the loads on each individual cell. Using this method of measurement, the maximum load will be the sum of the loads on the individual cells and the sensitivity will be the average value of these cells.

It is important that the user ensures that no cell is stessed beyond its maximum rating under any load condition.
